

Camipro API

CLIC has obtained access to the API used to identify the owner of a camipro. The API is only available from the EPFL network (either directly or via VPN) and thus not accessible from the server. It may be added to Clicketing's workflow if and only if the key was to be exposed to the client scanning the participants.

Route documentation is available [here](#). Note: authentication fails from the page or using the displayed command; instead of the header `Authorization`, pass the argument `-u clic` and enter the key.

For legal reasons, use of the API is limited to obtaining temporary information. This data **must not be stored** in a database, or any other form of persistent storage. It may only be used to search for a match in a pre-existing database, such as an event registration list.

Revision #5
